How a change reaches nisyroswines.com

Two independent paths. Code travels through Git and Netlify. Text and photos go live straight from the Google Sheet.

CODE PATH — sections/ · js/main.js · nisyros.css

minutes · needs a deploy

SESSION
Claude Code
attached to nicolazonca/nw
edits the source files, runs build.sh

→

PRODUCTION REPO
GitHub
nicolazonca/nw
branch claude/… pushed
index.html committed with the sources

→

REVIEW
Pull request
Nicola opens it from the compare URL, checks the deploy preview, merges into main

→

DEPLOY
Netlify
auto-build on merge to main: bash build.sh → index.html, served from the CDN

session opened on the wrong repo

UPSTREAM FORK PARENT
GitHub · hellosandro/nw
not in the deploy path

✕ Netlify never builds from here.
A branch pushed here cannot reach the site.

CONTENT PATH — wines · faces · config

instant · no deploy

CMS
Google Sheet
three tabs: wines, faces, config — copy, specs, Drive photo links

→

PUBLISHED
CSV per tab
one Google URL for each tab, refreshed when the sheet is saved

→

PROXY
Netlify redirect
/api/cms?sheet=…
200-redirect to Google, same origin, no CORS

RULE OF THUMB

words, specs, photos → the Google Sheet

layout, styles, scripts → the repo, then a PR

on page load

on merge

LIVE
nisyroswines.com
index.html from the Netlify CDN, then the sheet is fetched in the browser

Code change → branch → pull request → merge → build. Content change → save the sheet → reload the page.
